

Some claims concerning a tetrahedron ABCP based on an acute triangle ABC

Scale and position the tetrahedron so that the coordinates of A, B and C are $(x_1, y_1, 0)$, $(x_2, y_2, 0)$, $(x_3, y_3, 0)$, respectively, with $x_j = \cos \phi_j, y_j = \sin \phi_j (j = 1, 2, 3)$, and $\phi_1 + \phi_2 + \phi_3 = 0$.

Define the following:

$$\angle A = \angle CAB, \angle B = \angle ABC, \angle C = \angle BCA, \alpha = \angle BPC, \beta = \angle CPA, \gamma = \angle APB;$$

$$C_0 = \cos \alpha \cos \beta \cos \gamma, C_1 = \cos^2 \alpha, C_2 = \cos^2 \beta, C_3 = \cos^2 \gamma,$$

$$L = 2 [(y_1 + y_2 + y_3)(1 - C_0) + (1 - x_1)y_1(C_1 - 1) + (1 - x_2)y_2(C_2 - 1) + (1 - x_3)y_3(C_3 - 1)],$$

$$R = 2 [(1 + x_1 + x_2 + x_3)(1 - C_0) + (1 + x_1)x_1(C_1 - 1) + (1 + x_2)x_2(C_2 - 1) + (1 + x_3)x_3(C_3 - 1)],$$

$$H = 1 + 2C_0 - C_1 - C_2 - C_3, E = L^2 + (R+H)^2,$$

$$D = E^2 + 18EH^2 + 8(R+H)H[(R+H)^2 - 3L^2] - 27H^4.$$

The following (proven) constraints hold:

1. $H > 0$ (which is equivalent to $\alpha + \beta + \gamma < 2\pi, \alpha < \beta + \gamma, \beta < \alpha + \gamma, \gamma < \alpha + \beta$);
2. $A + \beta + \gamma < 2\pi, \alpha + B + \gamma < 2\pi, \alpha + \beta + C < 2\pi$;
3. $\beta + \gamma - \alpha < 2(B + C), \gamma + \alpha - \beta < 2(C + A), \alpha + \beta - \gamma < 2(C + A)$;
4. $\alpha < \angle A \rightarrow [\beta < \max \{ \angle B, \angle C + \alpha \} \wedge \gamma < \max \{ \angle C, \angle B + \alpha \}]$,
 $\beta < \angle B \rightarrow [\gamma < \max \{ \angle C, \angle A + \beta \} \wedge \alpha < \max \{ \angle A, \angle C + \beta \}]$,
 $\gamma < \angle C \rightarrow [\alpha < \max \{ \angle A, \angle B + \gamma \} \wedge \beta < \max \{ \angle B, \angle A + \gamma \}]$;
5. $\alpha < \angle A \rightarrow \cos \angle C \cos \beta + \cos \angle B \cos \gamma > 0$,
 $\beta < \angle B \rightarrow \cos \angle A \cos \gamma + \cos \angle C \cos \alpha > 0$,
 $\gamma < \angle C \rightarrow \cos \angle B \cos \alpha + \cos \angle A \cos \beta > 0$;
6. $(D > 0 \wedge \alpha < \angle A) \rightarrow (\beta < \angle B \vee \gamma < \angle C)$,
 $(D > 0 \wedge \beta < \angle B) \rightarrow (\gamma < \angle C \vee \alpha < \angle A)$,
 $(D > 0 \wedge \gamma < \angle C) \rightarrow (\alpha < \angle A \vee \beta < \angle B)$.

Also, experimental evidence strongly suggests that this collection of constraints is also sufficient for a suitable tetrahedron ABCP to exist for a given acute triangle ABC. At present though, this is just a conjecture.
