Some claims concerning a tetrahedron ABCP based on an acute triangle ABC

Consider a tetrahedron ABCP such that the triangle ABC is acute. Scale and position this tetrahedron in Cartesian space so that the coordinates of A, B and C are $(x_1, y_1, 0)$, $(x_2, y_2, 0)$ and $(x_3, y_3, 0)$, respectively, with $x_j = \cos \phi_j$, $y_j = \sin \phi_j$ (j = 1,2,3) and $\phi_1 + \phi_2 + \phi_3 = 0$.

Define the following:

$$\angle A = \angle \text{CAB} \;,\; \angle B = \angle \text{ABC} \;,\; \angle C = \angle \text{BCA} \;,\; \alpha = \angle \text{BPC} \;,\; \beta = \angle \text{CPA} \;,\; \gamma = \angle \text{APB} \;,\; \\ C_0 = \cos \alpha \cos \beta \cos \gamma \;,\; C_1 = \cos^2 \alpha \;,\; C_2 = \cos^2 \beta \;,\; C_3 = \cos^2 \gamma \;,\; \\ L = 2 \left[\; (y_1 + y_2 + y_3)(1 - C_0) + (1 - x_1) \, y_1 \, (C_1 - 1) + \; (1 - x_2) \, y_2 \, (C_2 - 1) + \; (1 - x_3) \, y_3 \, (C_3 - 1) \; \right] \;,\; \\ R = 2 \left[\; (1 + x_1 + x_2 + x_3)(1 - C_0) + (1 + x_1) \, x_1 \, (C_1 - 1) + \; (1 + x_2) \, x_2 \, (C_2 - 1) + \; (1 + x_3) \, x_3 \, (C_3 - 1) \; \right] \;,\; \\ H = 1 + 2C_0 - C_1 - C_2 - C_3 \;,\;\; E = L^2 + \; (R + H)^2 \;,\; \\ D = E^2 + 18 \, H^2 E + 8 H \, (R + H) \, [(R + H)^2 - 3L^2] - 27 H^4 \;.\;$$

The following (proven) constraints hold:

1.
$$H > 0$$
 (which is equivalent to $\alpha + \beta + \gamma < 2\pi$, $\alpha < \beta + \gamma$, $\beta < \gamma + \alpha$ and $\gamma < \alpha + \beta$);

2.
$$\angle A + \beta + \gamma < 2\pi$$
, $\alpha + \angle B + \gamma < 2\pi$, $\alpha + \beta + \angle C < 2\pi$;

$$3. \quad \beta + \gamma - \alpha < 2(\angle B + \angle C) \; , \; \gamma + \alpha - \beta < 2(\angle C + \angle A) \; , \; \; \alpha + \beta - \gamma < 2(\angle A + \angle B) \; ; \; \quad$$

4.
$$\alpha < \angle A \rightarrow [\beta < \max \{ \angle B, \angle C + \alpha \} \land \gamma < \max \{ \angle C, \angle B + \alpha \}]$$
,
 $\beta < \angle B \rightarrow [\gamma < \max \{ \angle C, \angle A + \beta \} \land \alpha < \max \{ \angle A, \angle C + \beta \}]$,
 $\gamma < \angle C \rightarrow [\alpha < \max \{ \angle A, \angle B + \gamma \} \land \beta < \max \{ \angle B, \angle A + \gamma \}]$;

5.
$$\alpha < \angle A \rightarrow \cos \angle C \cos \beta + \cos \angle B \cos \gamma > 0$$
,
 $\beta < \angle B \rightarrow \cos \angle A \cos \gamma + \cos \angle C \cos \alpha > 0$,
 $\gamma < \angle C \rightarrow \cos \angle B \cos \alpha + \cos \angle A \cos \beta > 0$;

6.
$$(D > 0 \land \alpha < \angle A) \rightarrow (\beta < \angle B \lor \gamma < \angle C),$$

 $(D > 0 \land \beta < \angle B) \rightarrow (\gamma < \angle C \lor \alpha < \angle A),$
 $(D > 0 \land \gamma < \angle C) \rightarrow (\alpha < \angle A \lor \beta < \angle B);$

7.
$$D > 0 \rightarrow [\alpha < \angle A \lor \alpha > \pi - \angle A \lor \beta < \angle B \lor \beta > \pi - \angle B \lor \gamma < \angle C \lor \gamma > \pi - \angle C].$$

Also, experimental evidence suggests that this collection of constraints is necessary and sufficient for a suitable tetrahedron ABCP to exist for a given acute triangle ABC. At present though, the sufficiency claim is only a conjecture. (Note: the arrows mean logical implication here.)
